

Enterprise rag application

The screenshot shows a web browser window with the address bar displaying "localhost:5173/login". The page content is a login form for the "Enterprise RAG Platform". The form is centered and has a light beige background. It contains the following elements:

- Enterprise RAG Platform**: The title of the application.
- Sign in to continue**: A subtitle or instruction.
- Username**: A label for the first input field.
- : A text input field for the username.
- Password**: A label for the second input field.
- : A password input field.
- Sign in**: A purple button to submit the login information.

The 4Dc:
Delegation
Delegation is making thoughtful decisions about what work is appropriate for you to do, for AI to do, or for you and AI to do together, and how to distribute those tasks.
Problem
Awareness
Clearly understanding your goals and the nature of the work before involving AI.
What am I trying to do?
What do you do well?
Platform
Awareness
Understanding the capabilities

#1 - 334 chars

plan
Task
Delegation
Thoughtfully distributing work between humans and AI to leverage the strengths of each.
Effective delegation requires both domain expertise and an understanding of AI capabilities.

Estimate linen weight for resource efficiency in washing machines

AI/ML models created a virtual sensor to optimize water and energy consumption

Challenge

- AI/ML models created a virtual sensor to optimize water and energy consumption

Solution

- A virtual sensor was created to estimate the dry weight of linen using AI/ML models based on sensor data

Value

- Significant energy and water savings were achieved

The solution has the potential to be deployed in hardware, enabling the virtual

Summary: Artificial Intelligence (AI) and Machine Learning (ML) are often used interchangeably, but they are distinct concepts. AI refers to the broader field of creating intelligent machines that can perform tasks that typically require human intelligence, such as reasoning, problem-solving, and decision-making. Machine Learning, on the other hand, is a subset of AI that involves training algorithms to learn from data and improve their performance on a specific task. In other words, AI is the umbrella term, while ML is a key technology used to achieve AI goals.

Intelligence (AI). From design and development to testing and maintenance, AI is ushering in unprecedented efficiencies and capabilities. AI can be applied at each stage of the product lifecycle to improve decisions, speed, and outcomes:

- Conceptualization and design
- Detailed design and prototyping
- Testing and optimization
- Manufacturing and maintenance
- End-of-life management
